-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 January 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Response to Amendment

1. This communication is in response to applicant's 01/20/2004 Amendment in the application of Lappetelainen for the "Adaptive transmission channel allocation method and system for ISM and unlicensed frequency bands" filed 11/27/2000. The proposed amendment to the claims has been entered and made of record. Claims 1-3, 6, 13-15 and 17 have been amended and new claims 20-23 have been added. Claims 1-23 are pending in the application.

Remarks

2. Applicant's amendment to the pending claims have been considered but are moot in view of the new ground(s) of rejection, and will be examined as discussed below. Furthermore, the rejections of record under 35 U.S.C. ' 103 of the claims are withdrawn in view of the newly discovered reference to Souissi et al. (US#6,327,300) and Foster, Jr. (US#5,528,623). Accordingly, This action is made Non-Final. Rejections based on the newly cited reference follows.

Claim Objections

3. Claim 15 is objected to because of the following informalities: On line 3, "the the non-frequency-hopping" should read --the non-frequency-hopping-- .

Appropriate correction is required.

Claim Rejections - 35 USC ' 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claims 11 and 12 recite the limitation "the communication channel" in line 1. There is insufficient antecedent basis for this limitation in the claims.

6. Claim 13 recites the limitation "the master device" in line 2. There is insufficient antecedent basis for these limitations in the claims.

Claim Rejections - 35 USC ' 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claims 1-5, 14-15 and 20-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mahany (US#5,696,903) in view of Souissi et al. (US#6,327,300).

With respect to claims 1-5, 14-15 and 20-23, both Mahany (US#5,696,903) and Souissi et al. (US#6,327,300) disclose a method and system for establishing a connection link in hierarchical communication system including a master device and slave devices. Mahany teaches in Figs. 1b,c diagrams illustrated the hierarchical communication system utilizing spread spectrum frequency hopping according to the essential features of the claims, in which the communication on the first local area network is accomplished by spread spectrum frequency hopping communication. A second local area network allows for radio communication between a portable computer device and peripheral devices with built-in transceivers utilized by the portable computer device, wherein the connection link between the computer device and peripheral devices, and the connection link among the peripheral devices being carried out in a frequency hopping fashion (See also Figs. 28a,b, and the Abstract; Col. 37, lines 13 plus and Col. 42, lines 31 plus).

Mahany do not disclose expressly wherein a non-frequency hopping connection link is established between the peripheral devices. However, Mahany teaches a MicroLink network which is a short range local area network consisting of a portable/mobile device and one or more peripherals. Peripherals are often slaved to a single portable/mobile device, but may be shared by two or more. A Microlink Network replaces cabled connection between a portable/mobile device and associated peripherals. In a preferred embodiment, the Microlink Network is a single frequency low power network operating at 2.400 to 2.483 GHz under 15.249 of the United States Federal Communications Commissions (FCC) rules. The FCC regulations allow unlicensed

Art Unit: 2665

communications at effective radiated power levels of approximately 500 microwatts or less. The Microlink Network is intended to provide communications between two or more devices operating within near proximity, e.g., distances of a few tens of feet (Col. 11, lines 39 plus). It's noted that a BLUETOOTH system network known as a piconet includes a single master device and up to seven active slave devices. The network topology is referred to as a star because all communication involves the master device, and it's well known in the art. In the same field of endeavor, Souissi et al. (US#6,327,300) discloses in Fig.2 a flow chart illustrated the steps involved in determining the mode of operation - non-frequency-hopping or frequency-hopping between a master and slave devices. A master 51 polls a slave 52 and the slave 52 requests a high speed channel that would employ open spectrum that is dynamically selected. Initially, it is assumed that data traffic to be sent to the master has just arrived at the slave 52 and the master is maintaining the piconet, e.g., polling the slaves (just one slave shown). When a poll by the master 51 is not scheduled, slave 52 searches a predetermined spectrum for the best available downlink communication resources or channels. In a Bluetooth communication system, the predetermined spectrum is ideally the ISM band. Next, the master 51 polls the slave 52 by transmitting data of a first type in a first occupied bandwidth. Preferably, this transmission is of a standard Bluetooth 1.0 type transmission. The slave 51 then requests the establishment of a high-speed link with the master 52 preferably using the standard Bluetooth 1.0 type signalling and suggesting the best available downlink channel (master-to-slave) just found. The master 52 verifies the channels suggested by the slave 51. If the master 52 finds the channels suggested by the slave 51 as an acceptable uplink (slave-to-master), the master 52 acknowledges the request of the slave 51 and signals its acceptance on the new downlink channel (high-speed) channel. This

Art Unit: 2665

high-speed channel would facilitate the transmission of data of a second type in a second occupied bandwidth wherein the second occupied bandwidth would be of variable bandwidth suitable for the transmission of the data. If the master 52 finds the channels suggested by the slave 51 as unacceptable, the master 52 will ideally search the ISM band for the best alternative channels, which are then sent to the slave 51 on the new downlink channel. In this way, the master 52 and the slave 51 may transmit on different channels ("split frequency operation") although ideally in the interest of spectral efficiency the master and slave will attempt to reuse the same channels on their first attempt. Alternatively, if the master finds the channels suggested by the slave 51 unacceptable, the master 52 will ideally search the ISM band for the best alternative channels, which are then suggested to the slave 51 on the new downlink channel. A negotiation ensues, with rules that include the options to decide to use any common channels between the master's and the slave's proposals. Once the data is transmitted, the master and slave revert to Bluetooth 1.0 type communications (Col. 2, lines 41 plus).

One skilled in the art would have recognized the need for effectively and efficiently facilitates operating in the non-frequency-hopping fashion in an environment where the frequency-hopping fashion is also used, and would have applied Souissi's novel use of dynamic spectrum allocation for transmission of data within a frequency band into Maahany's hierarchical communications system using frequency hopping. Therefore, It would have been obvious to a person of ordinary skill in the art at the time of the invention was made to apply Souissi's method and apparatus for dynamic spectrum allocation into Mahany's hierarchical communications system using microlink, data rate switching, frequency hopping and vehicular

local area networking with the motivation being to provide a method and system for allocation of an adaptive transmission channel in a piconet operating in the Bluetooth radio frequency band.

9. Claims 6-13 and 16-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mahany (US#5,696,903) in view of Souissi et al. (US#6,327,300) as applied to the claims above, and further in view of Foster, Jr. (US#5,528,623).

With respect to claims 6-13 and 16-19, Mahany and Souissi disclose the claimed limitations as discussed in the paragraph 8 above. In the same field of endeavor, Foster, Jr. discloses a communications system includes at least two communications units, each communication unit including a transmitter capable of transmitting to the other unit at different power levels and on different frequencies, the power levels and frequencies of transmission being controlled by a mode control unit in response to indicators of transmission quality and reliability, wherein the mode control unit initially establishes a minimum power output of the transmitter at a fixed frequency to establish communications and if reliable communications cannot be maintained, increasing the level of output power of the transmitter until reliable communications are established as indicated by signals returned from another unit in the communications system, and wherein the mode control unit changes the output frequency of the transmitter from a single frequency mode to a time division spread spectrum mode if the required power output level of the transmitter exceeds a first predetermined threshold (See Fig. 4A-B; Col. 1, lines 51 plus).

One skilled in the art would have recognized the need for effectively and efficiently facilitates operating in the non-frequency-hopping fashion in an environment where the

Art Unit: 2665

frequency-hopping fashion is also used, and would have applied Foster, Jr's mode control nit of a communication unit, and Souissi's novel use of dynamic spectrum allocation for transmission of data within a frequency band into Maahany's hierarchical communications system using frequency hopping. Therefore, It would have been obvious to a person of ordinary skill in the art at the time of the invention was made to apply Foster, Jr's cordless telephone system having automatic control of tranbsmitter power and frequency in response to changing conditions, and Souissi's method and apparatus for dynamic spectrum allocation into Mahany's hierarchical communications system using microlink, data rate switching, frequency hopping and vehicular local area networking with the motivation being to provide a method and system for allocation of an adaptive transmission channel in a piconet operating in the Bluetooth radio frequency band.

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The Callaway, Jr. et al. (US#6,275,500) is cited to show the method and apparatus for dynamic control of talk groups in a wireless network.

The Rodgers (US#6,400,751) is cited to show the adaptive frequency sharing method and apparatus.

The Haartsen (US#6,519,460) is cited to show the resource management in uncoordinated frequency hopping system

The Panasik et al. (US#6,643,278) is cited to show the wireless network circuits, system, and methods for frequency hopping with reduced packet interference.

The Zyren (US#6,377,608) is cited to show the pulsed beacon based interference reduction mechanism for wireless communication networks.

The Haartsen (US#6,405,048) is cited to show the method and system for autonomously allocating frequencies to a radio system sharing frequencies with an overlapping macro radio system.

The Bell (US#6,405,027) is cited to show the group call for a wireless mobile communication device using bluetooth.

The Mahany et al. (US#5,949,776) is cited to show the hierarchical communication system using premises, peripheral and vehicular local area networking.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to M. Phan whose telephone number is (703)305-1029. The examiner can normally be reached on Mon - Fri from 6:30 to 3:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Huy Vu, can be reached on (703) 308-6602. The fax phone number for the organization where this application or proceeding is assigned is (703)305-3988.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.

12. ***Any response to this action should be mailed to:***

Art Unit: 2665

Commissioner of Patents and Trademarks

Washington, D.C. 20231

or faxed to: (703) 872-9314, (for formal communications intended for entry)

Or: (703) 305-3988 (for informal or draft communications, please label "PROPOSED"

or "DRAFT")

Hand-delivered responses should be brought to Crystal Park II, 2021 Crystal Drive,

Arlington. VA., Sixth Floor (Receptionist).
